Appendix I: Interviews with Client

Mr. William Koh

Interview 1:

Date: 2024.4.24

Duration: 45 minutes

Location: Academic building

Please Introduce yourself

A: William, Physics teacher in DSI.

Q: What is the most serious problem that greatly affect your life?

A: The journey to work or any destination has to be planned manually using maps like Baidu Map to find out the specific destination, and trial and error to find the best timing. This often need to waste some time to try a few iterations to reach the optimum timing.

Q: What could be a possible solution to the problem, you are looking for what kinds of help?

A: If there is a software that can provide a smart search for me, like I input saying "I want to buy vegetarian breakfast and then go to school", the software can help me to search and give me a list of options with different timing and prices for me to choose.

Q: Could you clarify whether you require point-to-point navigation, multi-stop route planning, or a combination of both?

A: I need both. For individual users, a simple and intuitive point-to-point navigation is ideal. However, for logistics and delivery services, multi-stop optimization is crucial. The system should be able to dynamically rearrange stops based on real-time factors like traffic, estimated delivery times, and priority orders. I also need the ability for users to manually adjust the stop order if needed.

Q: What are some elements you think needed to contain?

A: It could be voice operated, provide the various distances, time based on actual traffic conditions, and options to make simple change.

Q: Have you tried some maps' platform such as Gaode Map?

A: Yes, I did use Baidu Map, Tengxun Map, Gaode Map, but not having the above feature, depending on the region and specific needs. Amap is great for real-time traffic updates and detailed road data in China. However, google-map may have a wider international coverage.

Q: I see, will you like to use a software or website?

A: I think I would like to take website as the best choice, as software always need to download and occupy a lot of storage of my phones. Compare to software, website have a more convenient way to do update or add some patches. So, I will prefer a website.

Q: What additional function you would like to add-on?

A: For me, I always travel by cars due to its convenience. So, the navigation system of car routine should be involved

first. Then, I prefer to record where I have traveled to or directed to, so that I am able to record my life. Of course, traffic condition should be able obtain by users.

Q: Would you also need a geofencing feature to notify dispatch when a vehicle enters or exits a designated area?

A: Yes, geofencing is important for tracking deliveries within specific service zones. For example, when a vehicle enters a customer's neighborhood, we want an automatic notification sent to both the customer and our dispatch team. It would also be helpful to track route deviations—if a driver goes off-course, the system should send an alert.
