Appendix II: Client Feedback

Mr. William Koh

Date: 2024.9.28
Duration: 45 minutes
Location: Wechat call

Q: How do you feel about the user interface?

A: It's very clean and tidy obviously, but sometime the color of the button can be lighter, and perform some changes when I press on it, so it will be easier to see. All the buttons are listed organized, well-functioned, it will be better if there will be some user manuals as the texts on the button are quite implicit, sometimes I may forgot the function of some buttons.

Q: Does the website fit into you daily usage?

A: From some extents yes, it directs me from home to work somedays, the route is accurate and directive enough. However, sometimes the map will direct me into a different route, so my time will be wasted. Also, I am not always sure whether I enter the correct position name or not, so it's better to add some reminders.

Q: Does the website fulfill your need of storing the data?

A: Yes, absolutely. The history table is organized tidily, and I was surprised that even the history record down the exact time that I search. One main requirement will be if the data in history table is editable, so I can delete those I don't like, or add some good scenic spots that I plan to travel.

Q: Is the bycar function working well for you?

A: Indeed, yes of course. Sometimes I may not travel by car due to the short distance I travel, so I decide to either take a bus or walk to the destination. I would like to have those two functions, such as by entering the starting point and destination, the website clearly has a route plan if I go by bus or on feet. For bus, I think there should be several travelling modes that I can choose, like spending less or traveling with less time, to fit in my daily usage with different situation.

Q: How do you like the function of searching your surroundings?

A: I like this the most as it can search different types of stores I can visit through my destination or starting point according to my preferences, so I am able to make plans when I am on the car. One improvement that can be made is to decrease the range or radius searched, sometimes every two stores are too far away from one and another.

Q: I'd love to hear your feedback. How was your overall experience using it?

A: From my perspectives, all the function supports my daily usage of map navigation system. All requirement asked by me had well-constructed and the design fit into the content. Overall, I'm really impressed with the real-time route optimization and multi-stop planning. The system adjusts quickly based on traffic updates, and our drivers appreciate the priority-based stop reordering. However, I noticed a few areas that could be improved.

Q: That’s great to hear! Could you share more details on the areas that need improvement?
A: Sure. The route suggestions are sometimes too rigid. If a driver wants to take an alternative route that isn't listed, they can't manually adjust the navigation easily. It would be helpful if the system could allow manual rerouting while still keeping the optimized path visible as a reference.

Q: How about the mapping integration? Did you feel the system provided accurate directions?
A: For the most part, the system provides accurate directions, especially in urban areas where Amap's real-time data is highly detailed. However, I’m noticed some inconsistencies in rural or less-developed regions, where road updates aren’t reflected quickly. In these areas, some routes suggested by the system are either outdated or not the most optimal, leading to unnecessary detours.

Thank you!.
