Appendix V: Advisor Discussion

Mr. Kenneth

Date: 2024.03.16
Duration: 15 minutes
Location: Inside the ICT room

Q: Is it possible to fully construct a map system by ourselves and develop on it?

A: It will be quite complex and waste of time. A better may be use of existing map API, and implementing of the libraries inside. Based on API, and connect to your own server to provide related service to your users.

Q: What are some ethical considerations when developing a guided system based on location data?

A: You may get to know the users' position, however, it does not consider as stealing of information, as the map system require the users' location to design the routes.

Q: What testing strategies should I use? Just basically testing if the API gives me the right locations, distances, and directions?

A: Exactly! You can use mock API responses to verify that your system interprets the data correctly. Also, try different types of locations—urban, rural, and remote—to ensure accuracy across various conditions.

Q: That makes sense. What about testing how my system interacts with different components?

A: That's where integration testing comes in. You need to check if your API works smoothly with your database and user interface. Try simulating different queries to see if the system pulls the right maps and routes without delays or errors.

Thank You!
